Abstract: This paper evaluates whether senior bank executive experience can influence bank outcomes during a financial crisis. Some bank executives in New York City in the crisis of 1907 possessed experience as a senior bank officer at the same bank in New York during the previous nationwide crisis of 1893. The evidence suggests that individual bank deposit losses at the same institution are correlated across these two crises. However, this correlation cannot be explained by the retention of top executives at the bank from the previous financial crisis.
